A binary number is a combination of 1s and 0s. Its nth least significant digit is the nth digit starting from the right starting with 1. Given a decimal number, convert it to binary and determine the value of the the 4th least significant digit. Example number = 23Convert the decimal number 23 to binary number: $23^{10} = 2^4 + 2^2 + 2^1 + 2^0 = (10111)_2$. The value of the 4th index from the right in the binary representation is 0. **Function Description** Complete the function fourthBit in the editor below. fourthBit has the following parameter(s): int number: a decimal integer Returns: int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number. Constraints 0 ≤ number < 2³¹ Input Format for Custom Testing Input from stdin will be processed as follows and passed to the function. The only line contains an integer, number. Sample Case 0 Sample Input 0 STDIN Function 32 → number = 32 Sample Output 0

0

Explanation 0

- Convert the decimal number 32 to binary number: 32₁₀ = (100000)₂.
- The value of the 4th index from the right in the binary representation is 0.

Sample Case 1

Sample Input 1

```
STDIN Function
-----
77 → number = 77
```

Sample Output 1

4

Explanation 1

- Convert the decimal number 77 to binary number: 77₁₀ = (1001101)₂.
- The value of the 4th index from the right in the binary representation is 1.

```
1 | /*
     * Complete the 'fourthBit' function below.
2
     * The function is expected to return an INTEGER.
4
     * The function accepts INTEGER number as parameter.
 6
    int fourthBit(int number)
9 ,
10
        int binary[32];
11
        int i=0;
        while(number>0)
12
13 •
            binary[i]=number%2;
14
15
            number/=2;
16
            i++;
17
        if(i>=4)
18
19 •
            return binary[3];
20
21
22
23
        else
24
        return 0;
25
```

	Test	Expected	Got	
~	printf("%d", fourthBit(32))	0	0	~
~	printf("%d", fourthBit(77))	1	1	~

Passed all tests! 🗸

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the pth element of the list, sorted ascending. If there is no pth element, return 0.

Example

Sample Input 0

STDIN Function

Sample Output 0

5

Explanation 0

Factoring n = 10 results in (1, 2, 5, 10). Return the $p = 3^{rd}$ factor, 5, as the answer.

Sample Case 1

Sample Input 1

STDIN Function

Sample Output 1

0

Explanation 1

Factoring n = 10 results in $\{1, 2, 5, 10\}$. There are only 4 factors and p = 5, therefore 0 is returned as the answer.

Sample Case 1

Sample Input 1

STDIN Function

10 → n = 10

5 → p=5

Sample Output 1

0

Explanation 1

Factoring n = 10 results in (1, 2, 5, 10). There are only 4 factors and p = 5, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

STDIN Function

1 → n=1

1 → p=1

Sample Output 2

-1

Explanation 2

Factoring n = 1 results in (1). The p = 1st factor of 1 is returned as the answer.

```
1 🔻
     * Complete the 'pthFactor' function below.
 2
 3
     * The function is expected to return a LONG INTEGER.
4
       The function accepts following parameters:

    LONG INTEGER n

 6
        LONG INTEGER p
9
10
     long pthFactor(long n, long p)
11 *
          int count=0;
12
         for(long i=1;i<=n;++i)</pre>
13
14 *
          {
              if(n%i==0)
15
16 *
17
                  count++;
                  if(count==p)
18
19 •
                      return i;
20
21
22
23
24
          return 0;
25
```

	Test	Expected	Got	
~	printf("%ld", pthFactor(10, 3))	5	5	~
~	printf("%ld", pthFactor(10, 5))	0	0	~
~	printf("%ld", pthFactor(1, 1))	1	1	~

Passed all tests! <
